

Equipment problems, reported right the first time.

Aviselle turns a clinician's quick description of a broken device into a complete, prioritized repair report for your biomed team, without a form to fill in.

Vague tickets mean phone tag, slower repairs and devices out of service for longer.

- | | |
|--|--|
|  Talk or type
Describe the problem out loud, hands-free, or type it when the unit is noisy. |  Asks only what's missing
A detailed first message can go straight to a finished report. No checklist. |
|  Scan or snap the device
Scan the barcode or photograph the asset tag. The photo travels with the report. |  Triage built in
Each report arrives marked Routine, High or Critical, based on what was reported. |
|  Routes itself
Goes to the people your admin picks, plus the vendor rep for that brand. |  Patient privacy by design
Designed to keep patient names, record numbers and diagnoses out of reports. |

Also included: equipment manuals · one year of report history · Face ID sign-in · admin-controlled access

What a pilot looks like

SMALL, MEASURED, LOW-RISK

Your departments, real users

Pilot in the departments where equipment issues cost your team the most time.

You control access

Your admin approves every user. Nobody outside your organization can join.

Nothing to integrate

Reports arrive by email in inboxes you already use. No CMMS or EHR project to start.

Measured together

We agree up front on what success looks like, and you are free to stop at any time.

Start with fifteen minutes.
